File Beat + ELK(Elastic, Logstash and Kibana) Stack to index logs to Elasticsearch - Hello World Example

Code Analy

use ELK stack for Spring Boot logs. (/spring/springboot-reading log files using the logstash filereader.

Pattern Generator Tool (/grok) for creating, testing and logstash. Suppose we have to read data from multiple search. One option is to install logstash on all the servers server.

Logstash consumes a lot of resources so it is not an optimum solution to have logstash installed on all fileservers. Instead we can use Beats in such scenarios.

Heartbeat

Monitoring

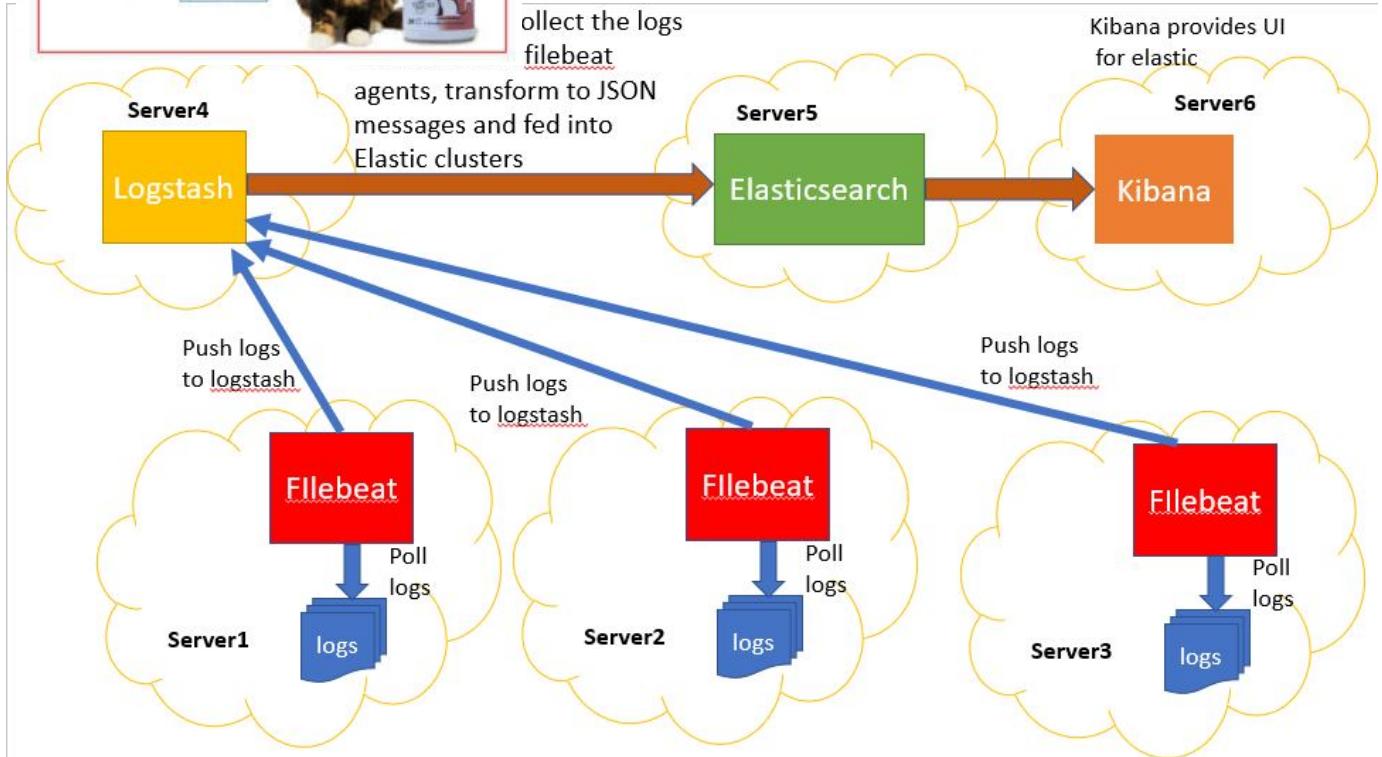

Functionbeat

Serverless Shipper

that we install as agents on servers to send specific types of logs to Logstash. Then Logstash will then filebeat to multiple servers, these will then read the logs and forward them to Elasticsearch. Finally we will use Filebeat to read the log file and send it to Kibana.

Video

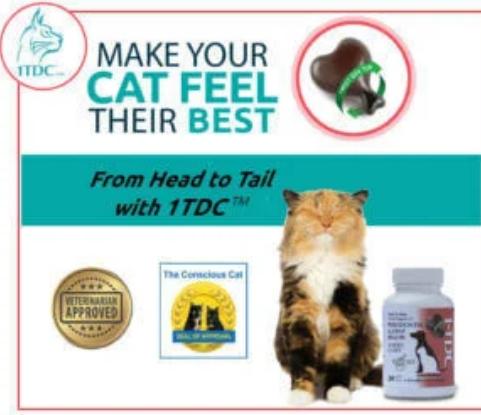

This tutorial is explained in the below Youtube Video.

is not affiliated with the Elastic company.

- **Kibana -**

- Download the latest version of kibana from Kibana downloads
(<https://www.elastic.co/downloads/kibana>)

The screenshot shows the official Elastic website at <https://www.elastic.co>. The top navigation bar includes links for Products, Cloud, Services, Customers, and Learn. A search bar is present on the right. The main content area is titled "Download Kibana". On the left, there's a promotional banner for "Robinson's SHOEMAKERS" featuring a pair of tan leather brogues. Below it is another banner for "MAKE YOUR CAT FEEL THEIR BEST" with the text "From Head to Tail with 1TDC™" and images of a cat and a product bottle. To the right, there are two buttons: "GA RELEASE" (highlighted in blue) and "PREVIEW RELEASE". Release details listed include Version: 6.5.1, Release date: November 20, 2018, License: [Elastic License](#), and download links for Windows, Mac, Linux, RPM, and DEB packages.

- Modify the kibana.yml to point to the elasticsearch instance. In our case this will be 9200. So uncomment the following line in kibana.yml-

```
elasticsearch.url: "http://localhost:9200"
```

- Run the kibana.bat using the command prompt. kibana UI can then be accessed at localhost:5601

- **Logstash -**

- Download the latest version of logstash from Logstash downloads
(<https://www.elastic.co/downloads/logstash>)

[Close X](#)

The screenshot shows the official Elastic website at <https://www.elastic.co/downloads/logstash>. The main navigation bar includes 'Products', 'Cloud', 'Services', 'Customers', and 'Learn'. A banner for 'Robinson's SHOEMAKERS' is visible on the left. The central content area is titled 'Download Logstash' and includes a 'Migration Guide' link. Below this, there are two buttons: 'GA RELEASE' (blue) and 'PREVIEW RELEASE' (white). Release details are listed: Version 6.5.1, Release date November 20, 2018, License Elastic License, and download links for TAR.GZ, ZIP, and RPM.

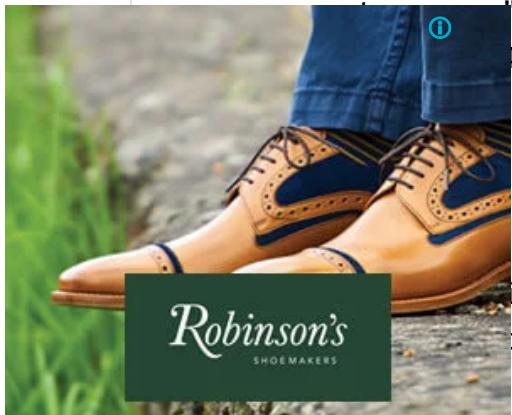

When using the `filebeat`, we are ingesting the data to Elasticsearch, the data is initially unstructured. We first need to break the data into structured format and then ingest it to Elasticsearch. Such data can then be later used for analysis. This data manipulation of unstructured data to structured is done by Logstash. Logstash itself makes use of grok filter to achieve this.

Similar to how we did in the Spring Boot + ELK tutorial (<https://www.java-inuse.com/spring/springboot-microservice-elk>), create a configuration file named `logstash.conf`. Here Logstash is configured to listen for incoming Beats connections on port 5044. Also on getting some input, Logstash will filter the input and index it to Elasticsearch.

You can make use of the Online Grok Pattern Generator Tool (`/grok`) for creating, testing and debugging grok patterns required for logstash.

[RPM 32-BIT sha](#)

[RPM 64-BIT sha](#)

- Unzip the contents. Open filebeat.yml and add the following content. We are specifying the logs location for the filebeat to read from. The hosts specifies the Logstash server and the port on which Logstash is configured to listen for incoming Beats connections.

[Close X](#)

filebeat:
prospectors:

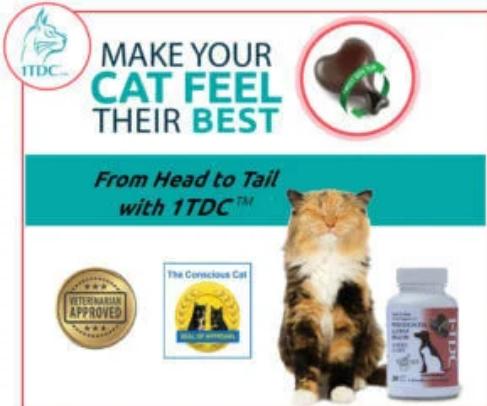

ern: '^[0-9]{4}-[0-9]{2}-[0-9]{2}'

ce: true

n: after

;t:5044"]

```
-c filebeat.yml
```

```
6>filebeat.exe -c filebeat.yml
```

Next copy the log file to the C:/elk folder.

	Name	Date modified	Type	Size
5	test.log	11/28/2018 4:48 PM	Text Document	8 KB

Filebeat will start harvesting it and sending it to logstash which will in turn index it to elasticsearch.
